

Introduction to Physical Science

- Introduction to Physical Science
- Matter
- Chemistry
- Force and Motion
- Energy
- Waves, Sound and Light
- Electricity and Magnetism

What is Science?

- Science is a method for studying the natural world.
- It is a process that uses and to gain knowledge about events in nature

What is Science?

- Nature follows a set of rules
- many rules, such as those concerning how the human body works, are complex

What is Science?

- Other rules, such as the fact that Earth rotates about once every 24 h, are much
- Scientists ask questions to learn about the natural world.

Defining Science

- Life Science
 - the study of living organisms
- Earth Science
 - the study of Earth and space
- Physical Science
 - the study of matter and energy
 - chemistry & physics

Defining Science

- Sometimes, a scientific study will overlap the categories.
- One scientist, for example, might study the motions of the Human body to understand how to build better artificial limbs.

States of Matter

A. The Kinetic Theory

1. All matter is composed of small particles (atoms, molecules, or ions).
2. They are in constant, random motion.
3. They constantly collide with each other and with the walls of their container.

Gas

Liquid

Solid

B. Phase Properties

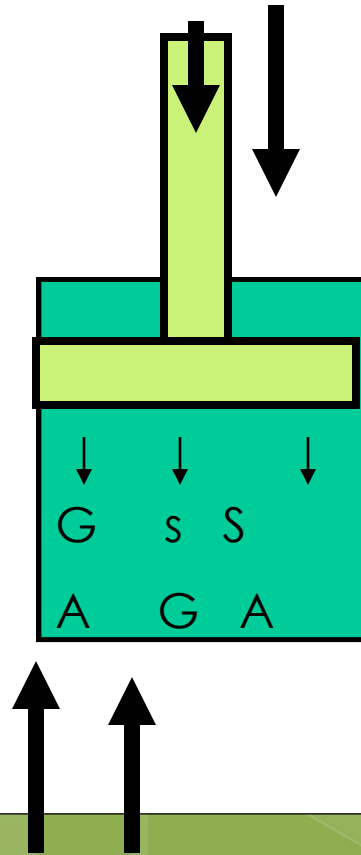

Particle Properties

Phase	Proximity	Energy	Motion	Volume	Shape
Solid	close	little	vibrational	definite	definite
Liquid	close	moderate	rotational	definite	indefinite
Gas	far apart	a lot	translational	indefinite	indefinite

Boyle's Law.

The volume of a gas varies inversely with its pressure if temperature remains constant

Pushing the plunger down will increase the pressure

Volume of the gas inside the cylinder will decrease

Pressure increases inside the cylinder because the volume is smaller

Charles's Law

The volume of a gas varies directly with its temperature if pressure remains constant

A balloon shrinks when placed in cold water

Why is the Periodic Table important to me?

- The periodic table is the most useful tool to a chemist.
- You get to use it on every test.
- It organizes lots of information about all the known elements.

Pre-Periodic Table Chemistry ...

- ...was a mess!!!
- No organization of elements.
- Imagine going to a grocery store with no organization!!
- Difficult to find information.
- Chemistry didn't make sense.

Dmitri Mendeleev: Father of the Table

HOW HIS WORKED...

- Put elements in rows by increasing atomic weight.
- Put elements in columns by the way they reacted.

1834-1907

SOME PROBLEMS...

- He left blank spaces for what he said were undiscovered elements. (Turned out he was right!)
- He broke the pattern of increasing atomic weight to keep similar reacting elements together.

The Periodic Law

- Properties of elements are a periodic function of their Atomic Numbers.
- So...this means that when you arrange the elements according to their atomic numbers, you see a repetition of their physical and chemical properties.

Relation to elements....

- Chemical elements are arranged in groups that have similar chemical and physical properties.

Periodic Table of Elements

CHEMISTRY

Composition of Matter

- **Matter** - Everything in universe is composed of matter
- Matter is anything that **occupies space or has mass**
- **Mass** - quantity of matter an object has
- **Weight** - pull of gravity on an object

Elements

- Pure substances that cannot be broken down chemically into simpler kinds of matter
- More than 100 elements (92 naturally occurring)

Legend:

- s-block elements
- p-block elements
- d-block elements
- f-block elements

- 90% of the mass of an organism is composed of 4 elements (oxygen, carbon, hydrogen and nitrogen)
- Each element unique chemical symbol
 - Consists of 1-2 letters
 - First letter is always capitalizec

Atoms

- The simplest particle of an element that retains all the properties of that element
- **Properties of atoms** determine the structure and properties of the matter they compose
- Our understanding of the structure of atoms based on **scientific models**, not observation

The Nucleus

- Central core
- Consists of positive charged protons and neutral neutrons
- Positively charged
- Contains most of the mass of the atom

The Protons

- All atoms of a given element have the same number of protons
- Number of protons called the atomic number
- Number of protons balanced by an equal number of negatively charged electrons

The Neutrons

- The **number varies** slightly among atoms of the same element
- Different number of neutrons produces **isotopes** of the same element

Atomic Mass

- Protons & neutrons are found in the **nucleus** of an atom
- Protons and neutrons each have a mass of **1 amu (atomic mass unit)**
- The **atomic mass** of an atom is found by adding the number of protons & neutrons in an atom
- # of protons + # of neutrons = atomic mass

The Electrons

- Negatively charged high energy particles with little or no mass
- Travel at very high speeds at various distances (energy levels) from the nucleus
- Are located around the nucleus

Periodic Table

- Elements are arranged by their atomic number on the **Periodic Table**
- The horizontal rows are called **Periods** & **tell the number of energy levels**
- Vertical groups are called **Families** & **tell the outermost number of electrons**

Br - liquid

Tc - synthetic

Non-Metals

Transition Metals

Rare Earth Metals

Halogens

Alkali Metals

Alkali Earth Metals

Other Metals

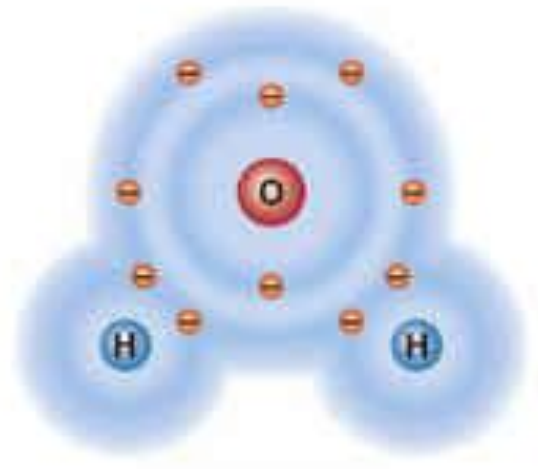

Inert Elements

Compounds

- Most elements do not exist by themselves
- Readily combine with other elements in a predictable fashion

- A **compound** is a pure substance made up of atoms of two or more elements
 - The proportion of atoms are always fixed
- **Chemical formula** shows the kind and proportion of atoms of each element that occurs in a particular compound

○ Molecules are the simplest part of a substance that retains all of the properties of the substance and exists in a free state

○ Some molecules are **large and complex**

CH_4 methane

CFC chlorofluro carbon

Chemical Formulas

- Subscript after a symbol tell the number of atoms of each element
- H₂O has 2 atoms of hydrogen & 1 atom of oxygen
- Coefficients before a formula tell the number of molecules
- 3O₂ represents 3 molecules of oxygen or (3x2) or 6 atoms of oxygen

- The tendency of elements to combine and form compounds depends on the number and arrangement of electrons in their outermost energy level
- **Atoms are most stable when their outer most energy level is filled (when it has 8 electrons)**

- Most atoms are not stable in their natural state
- **Tend to react** (combine) with other atoms in order to become more stable (undergo chemical reactions)
- In **chemical reactions** bonds are broken; atoms rearranged and new chemical bonds are formed that store **energy**

Covalent Bonds

- Formed when two atoms share one or more pairs of electrons

Water (H₂O)

Ionic Bonds

- Some atoms become stable by losing or gaining electrons
- Atoms that lose electrons are called positive ions

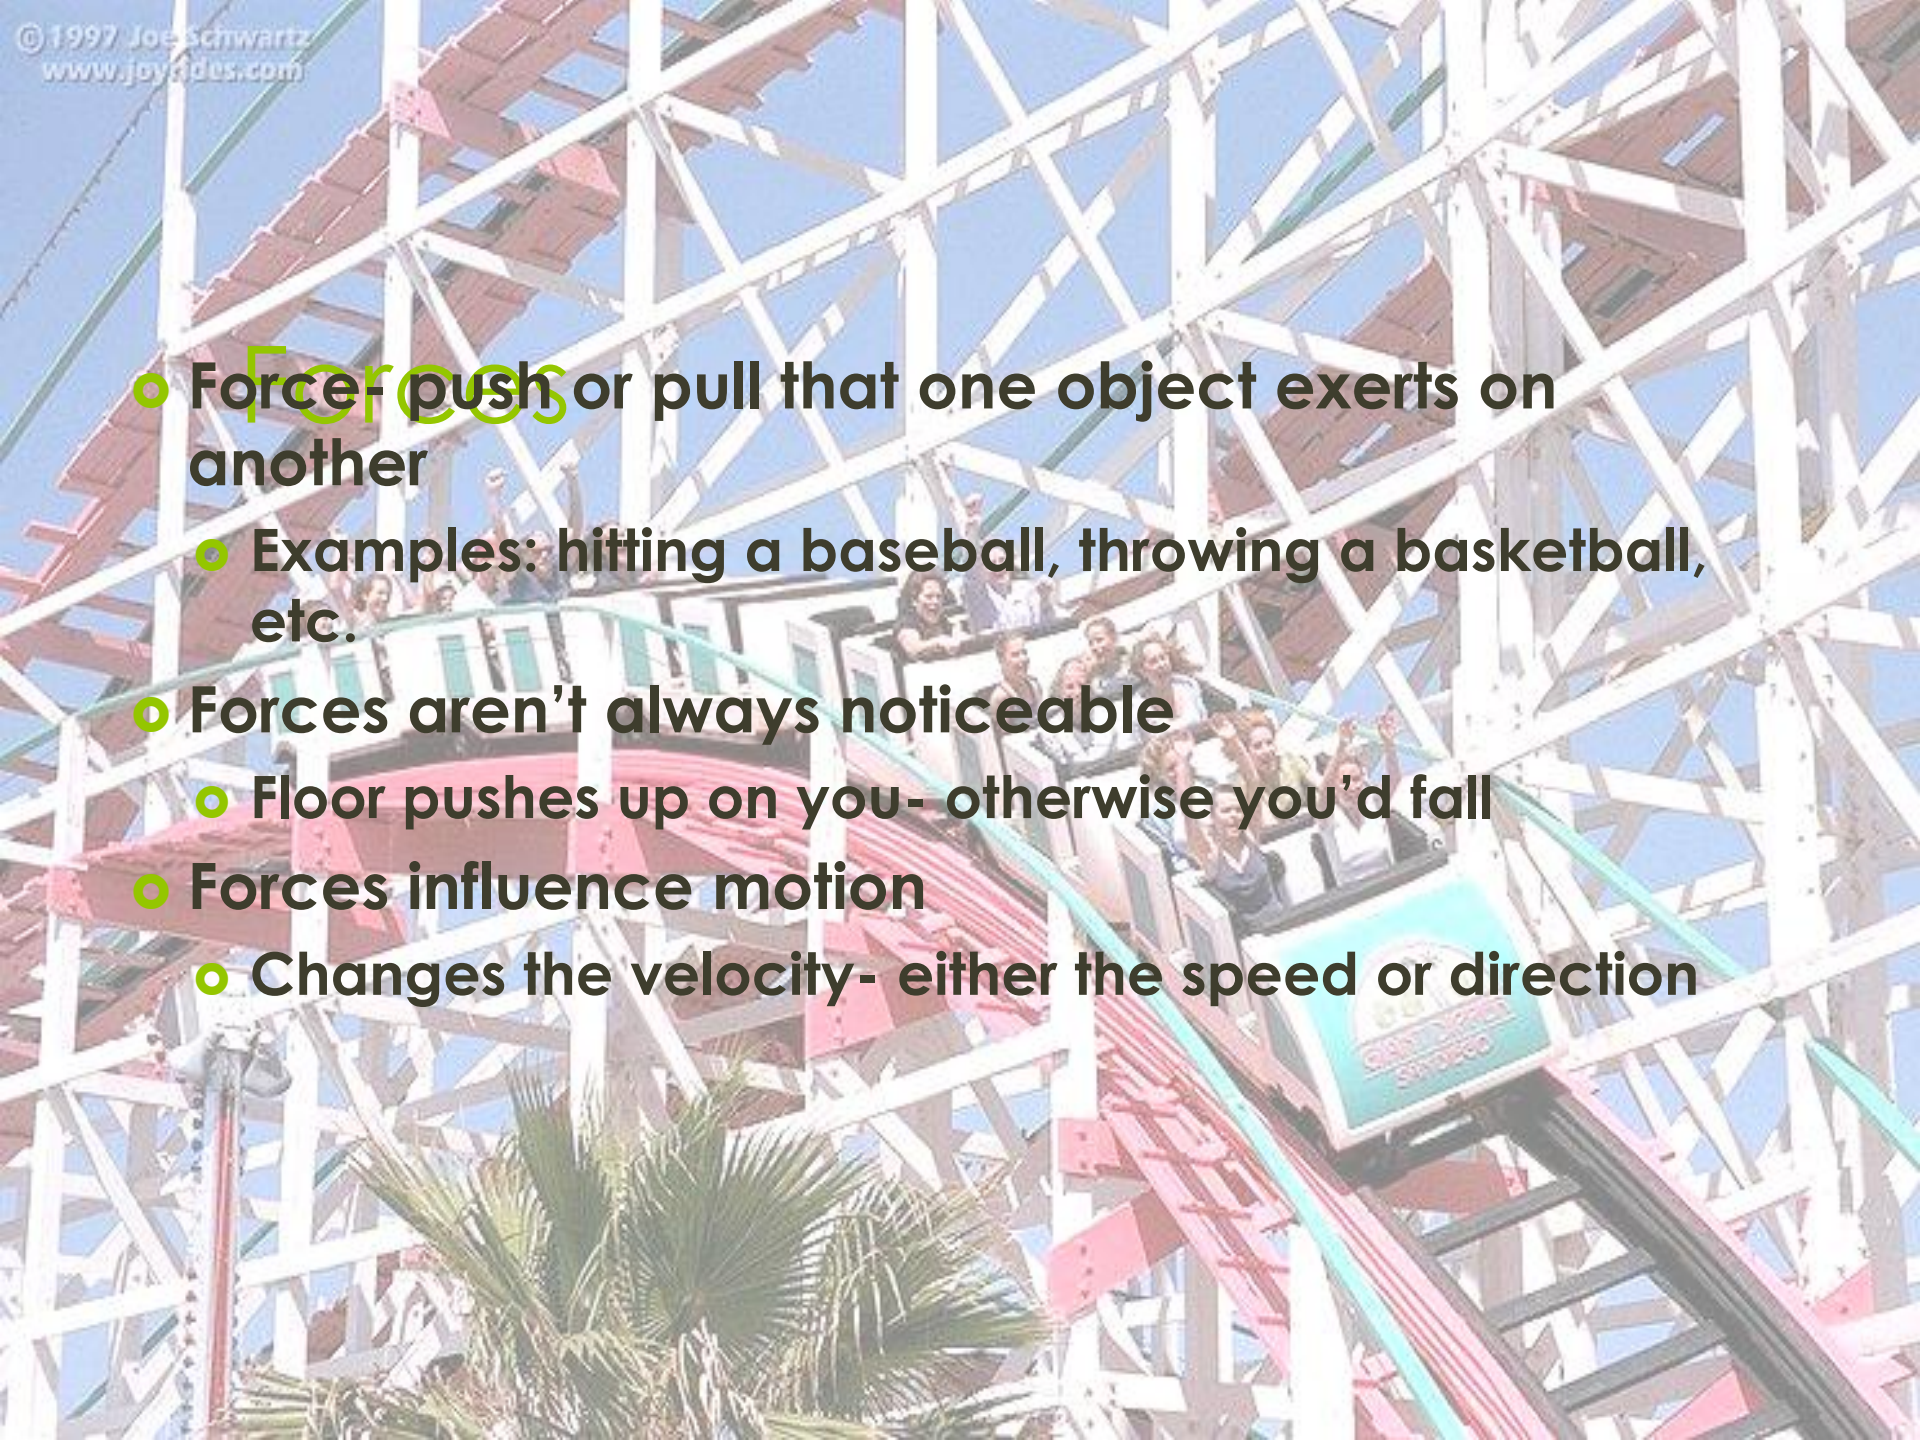

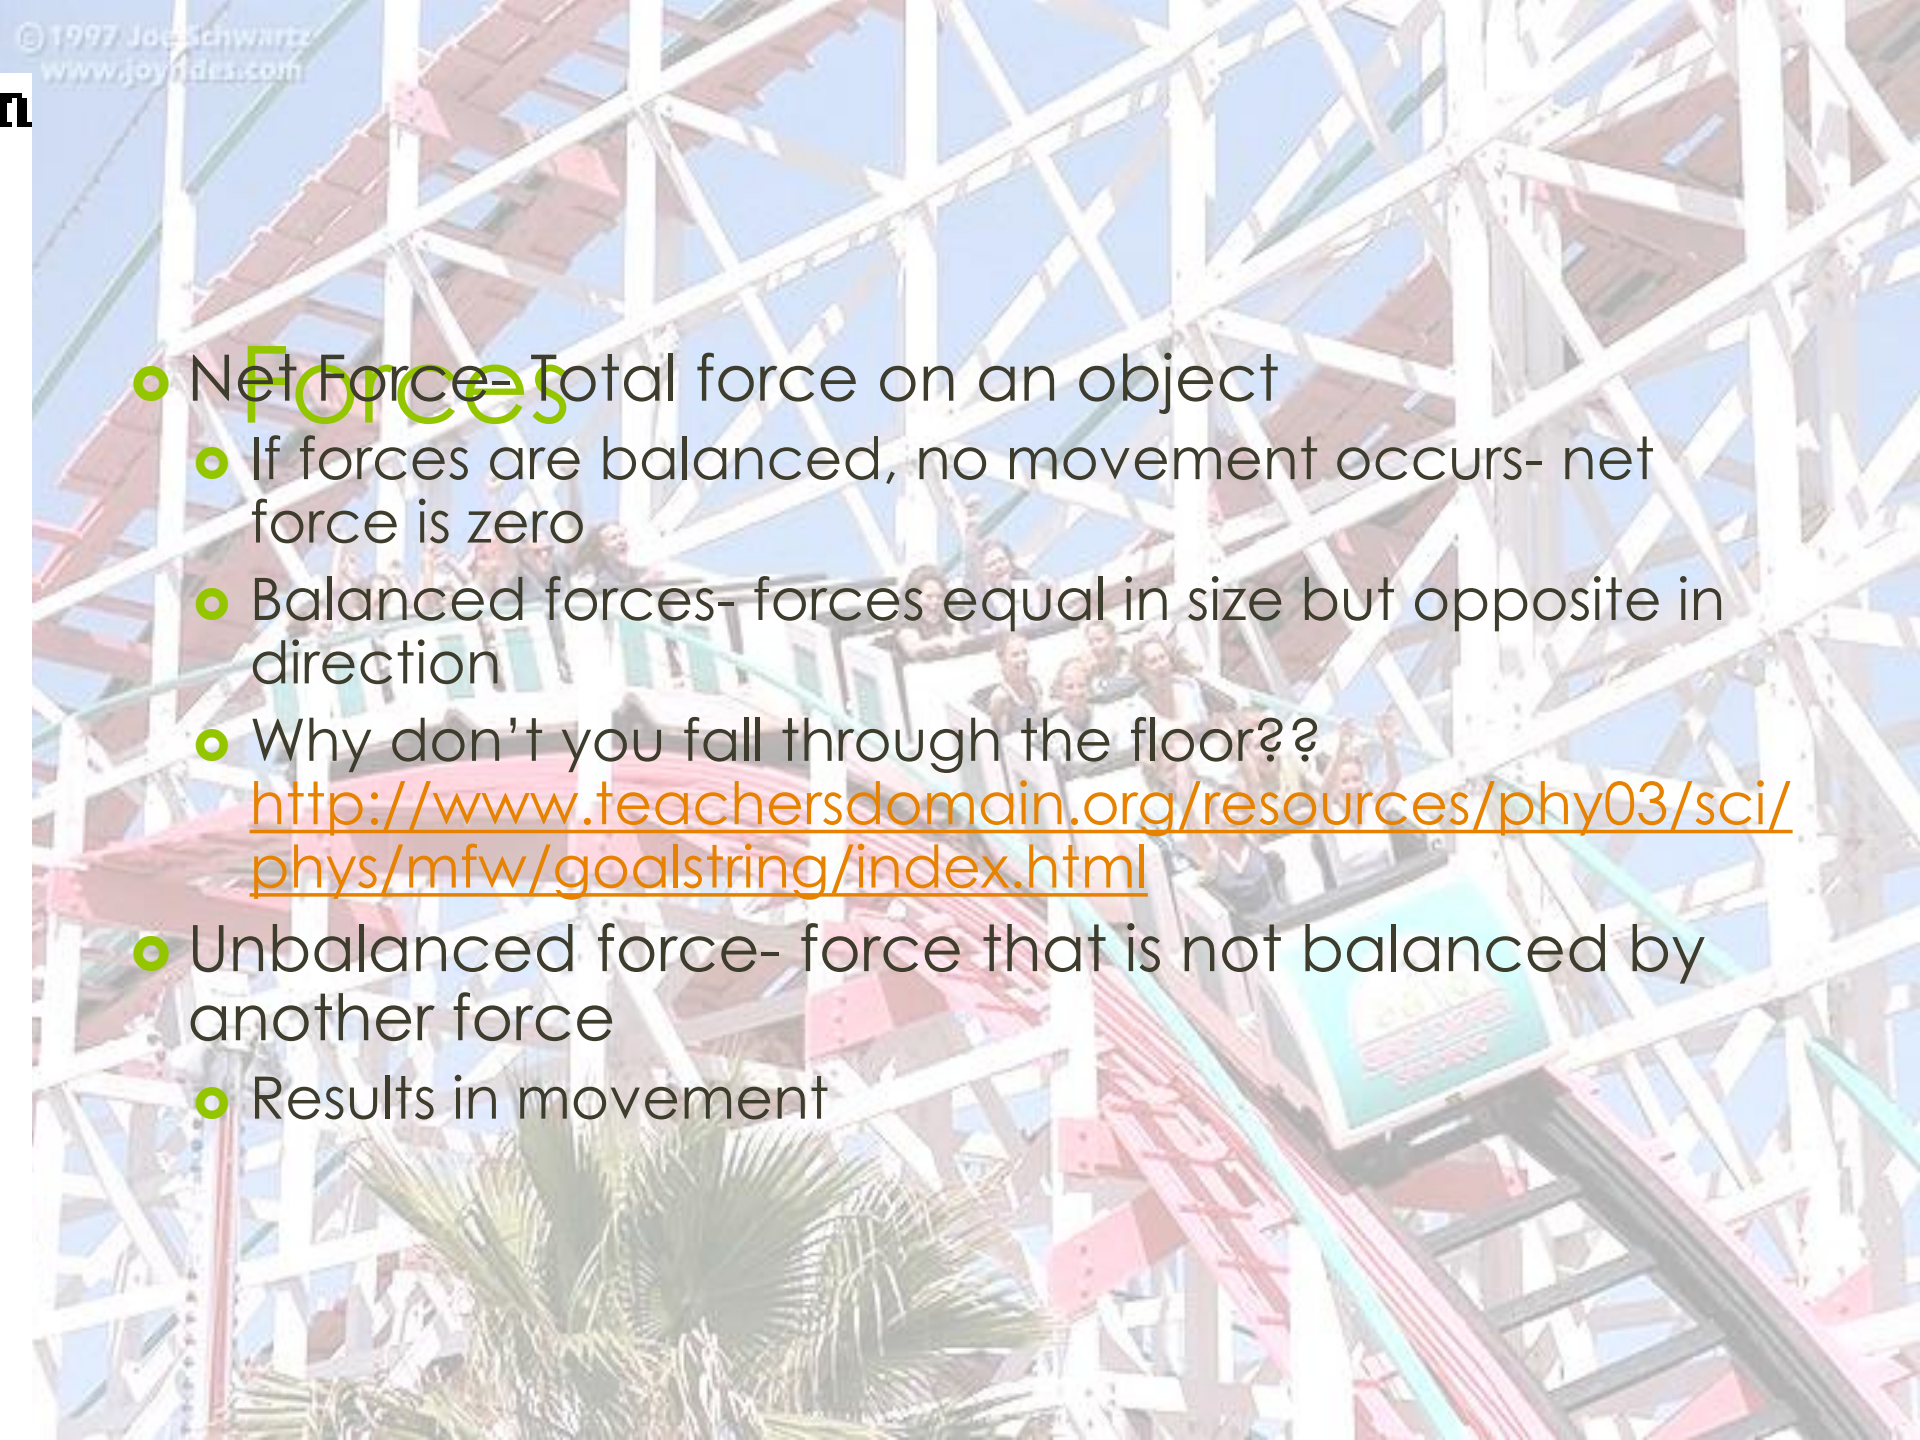

- Atoms that gain electrons are called negative ions
- Because positive and negative electrical charges attract each other ionic bonds form

Motion and Forces

- 
- A photograph of a roller coaster car filled with people, positioned on a track that is part of a large wooden structure. The car is moving downwards along a steep track. The background is a clear blue sky. The roller coaster's structure is made of white and red wooden beams. The car is green and white with a sign that says "CASH FOR SMOOTHIES".
- **Forces** push or pull that one object exerts on another
 - Examples: hitting a baseball, throwing a basketball, etc.
 - Forces aren't always noticeable
 - Floor pushes up on you- otherwise you'd fall
 - Forces influence motion
 - Changes the velocity- either the speed or direction

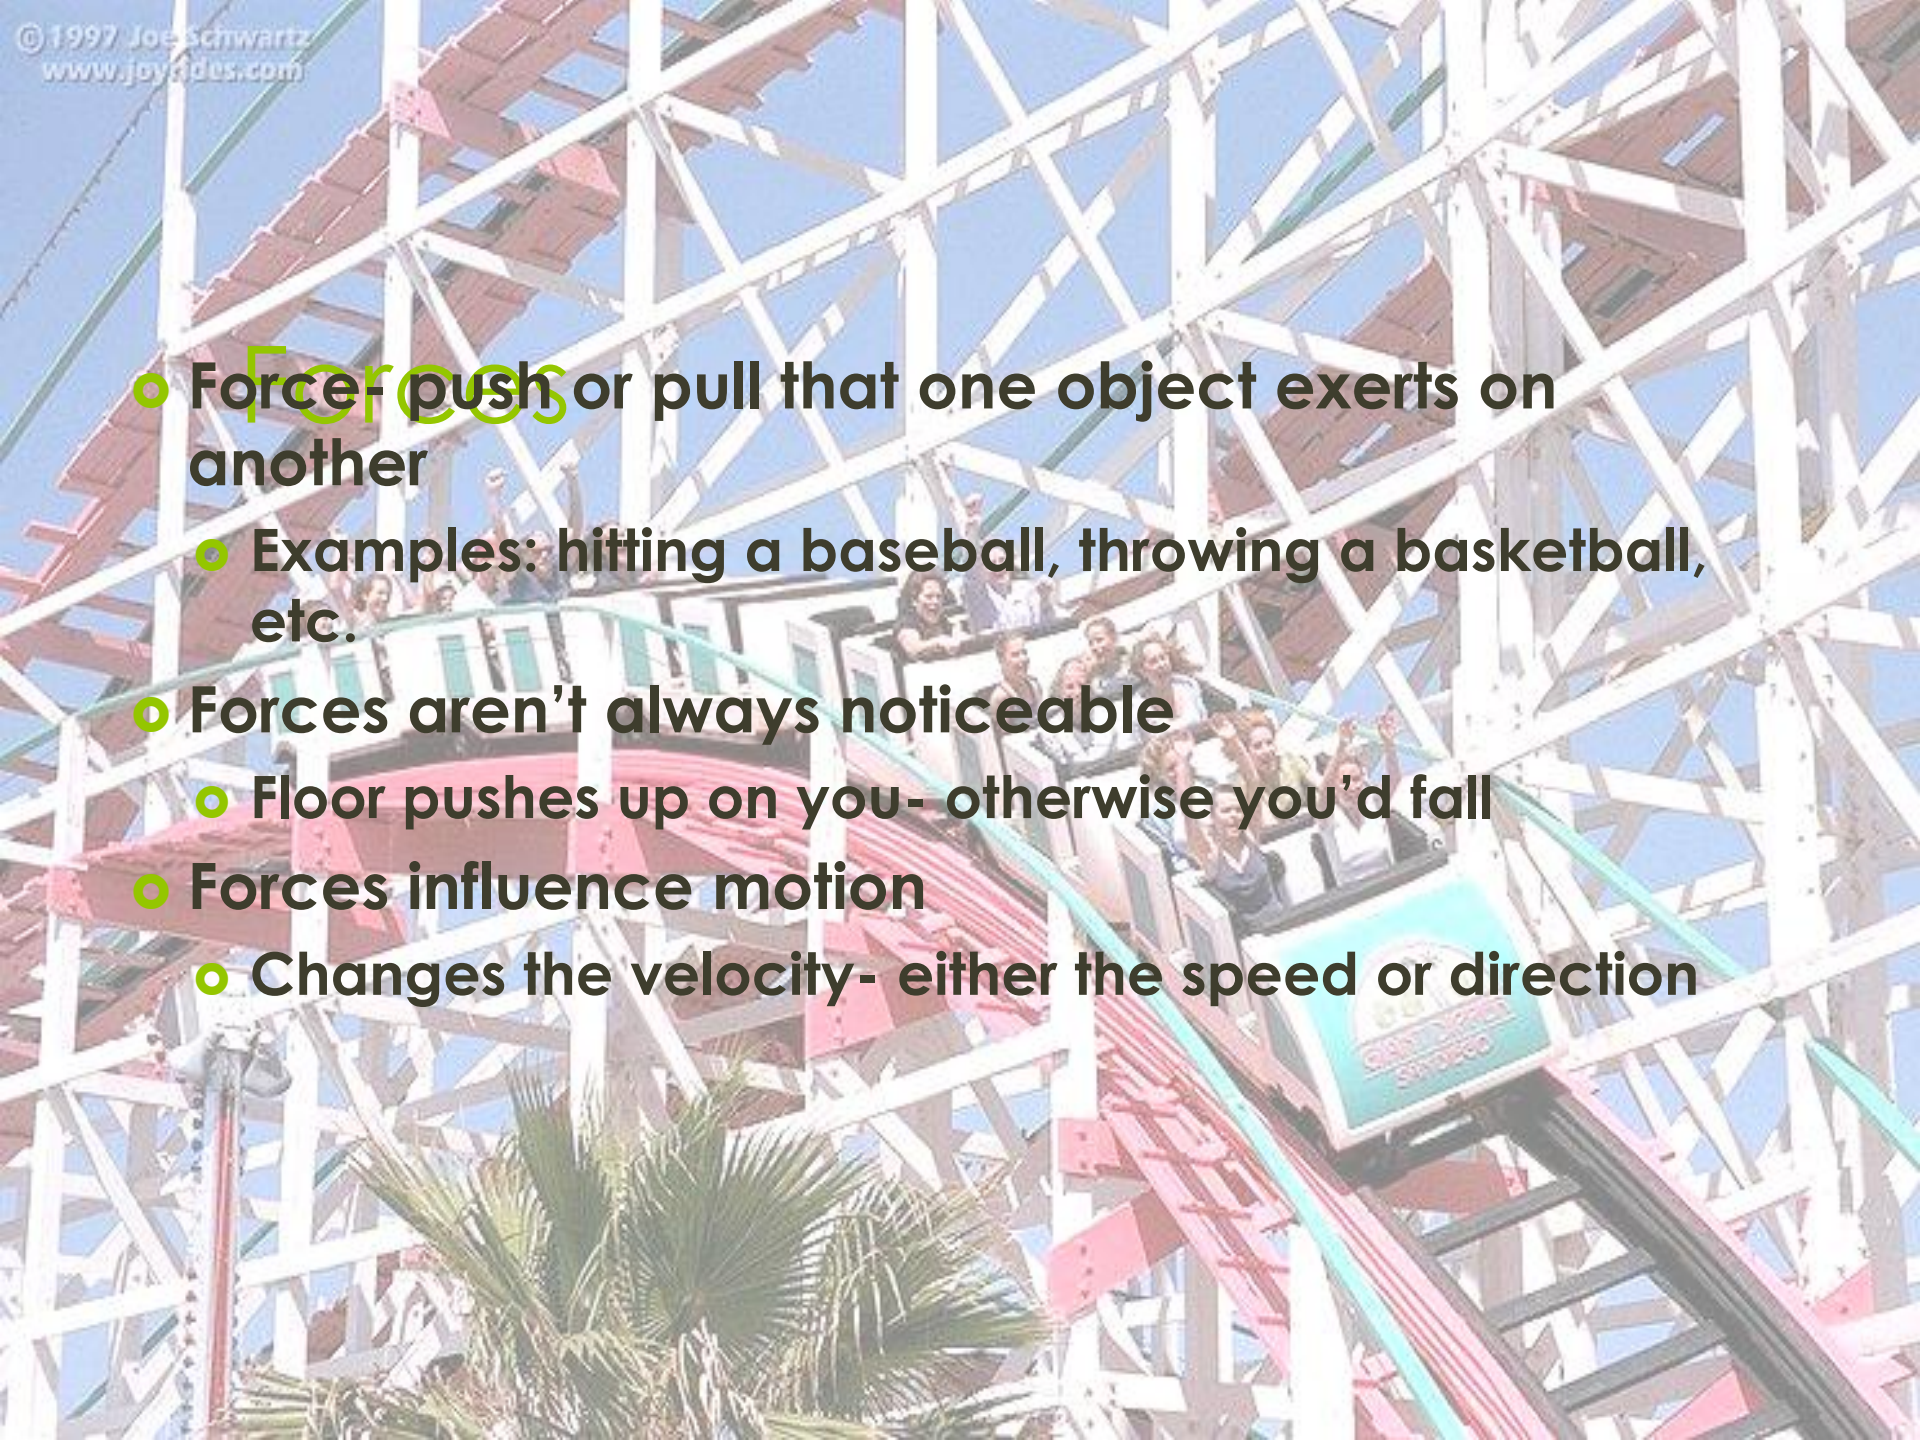

- 
- # Forces
- Net Force= Total force on an object
 - If forces are balanced, no movement occurs- net force is zero
 - Balanced forces- forces equal in size but opposite in direction
 - Why don't you fall through the floor??
<http://www.teachersdomain.org/resources/phy03/sci/phys/mfw/goalstring/index.html>
 - Unbalanced force- force that is not balanced by another force
 - Results in movement

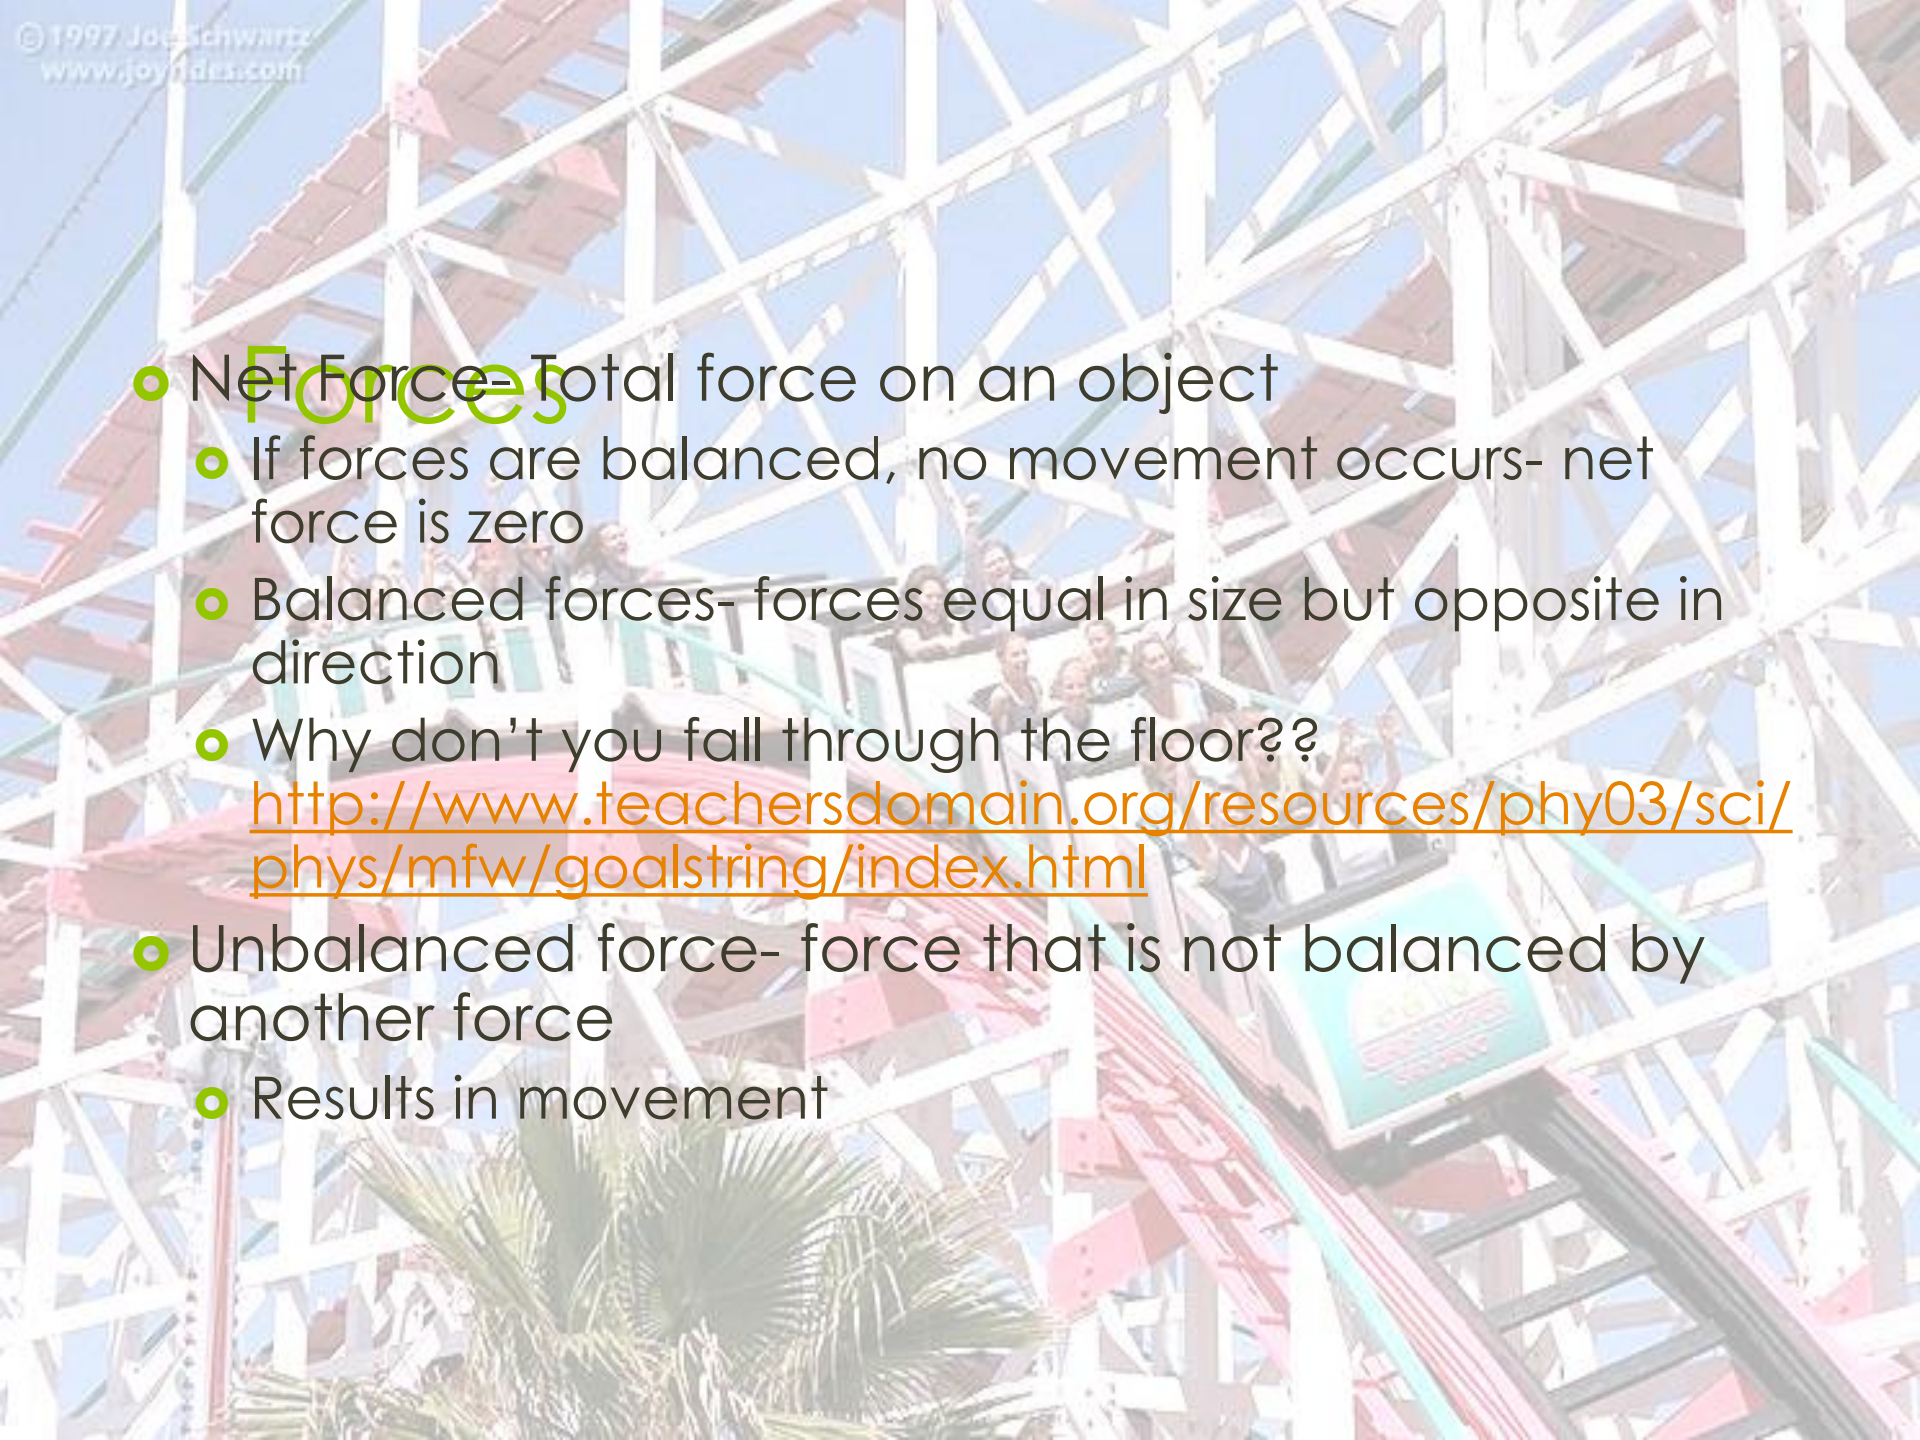

Motion and Forces

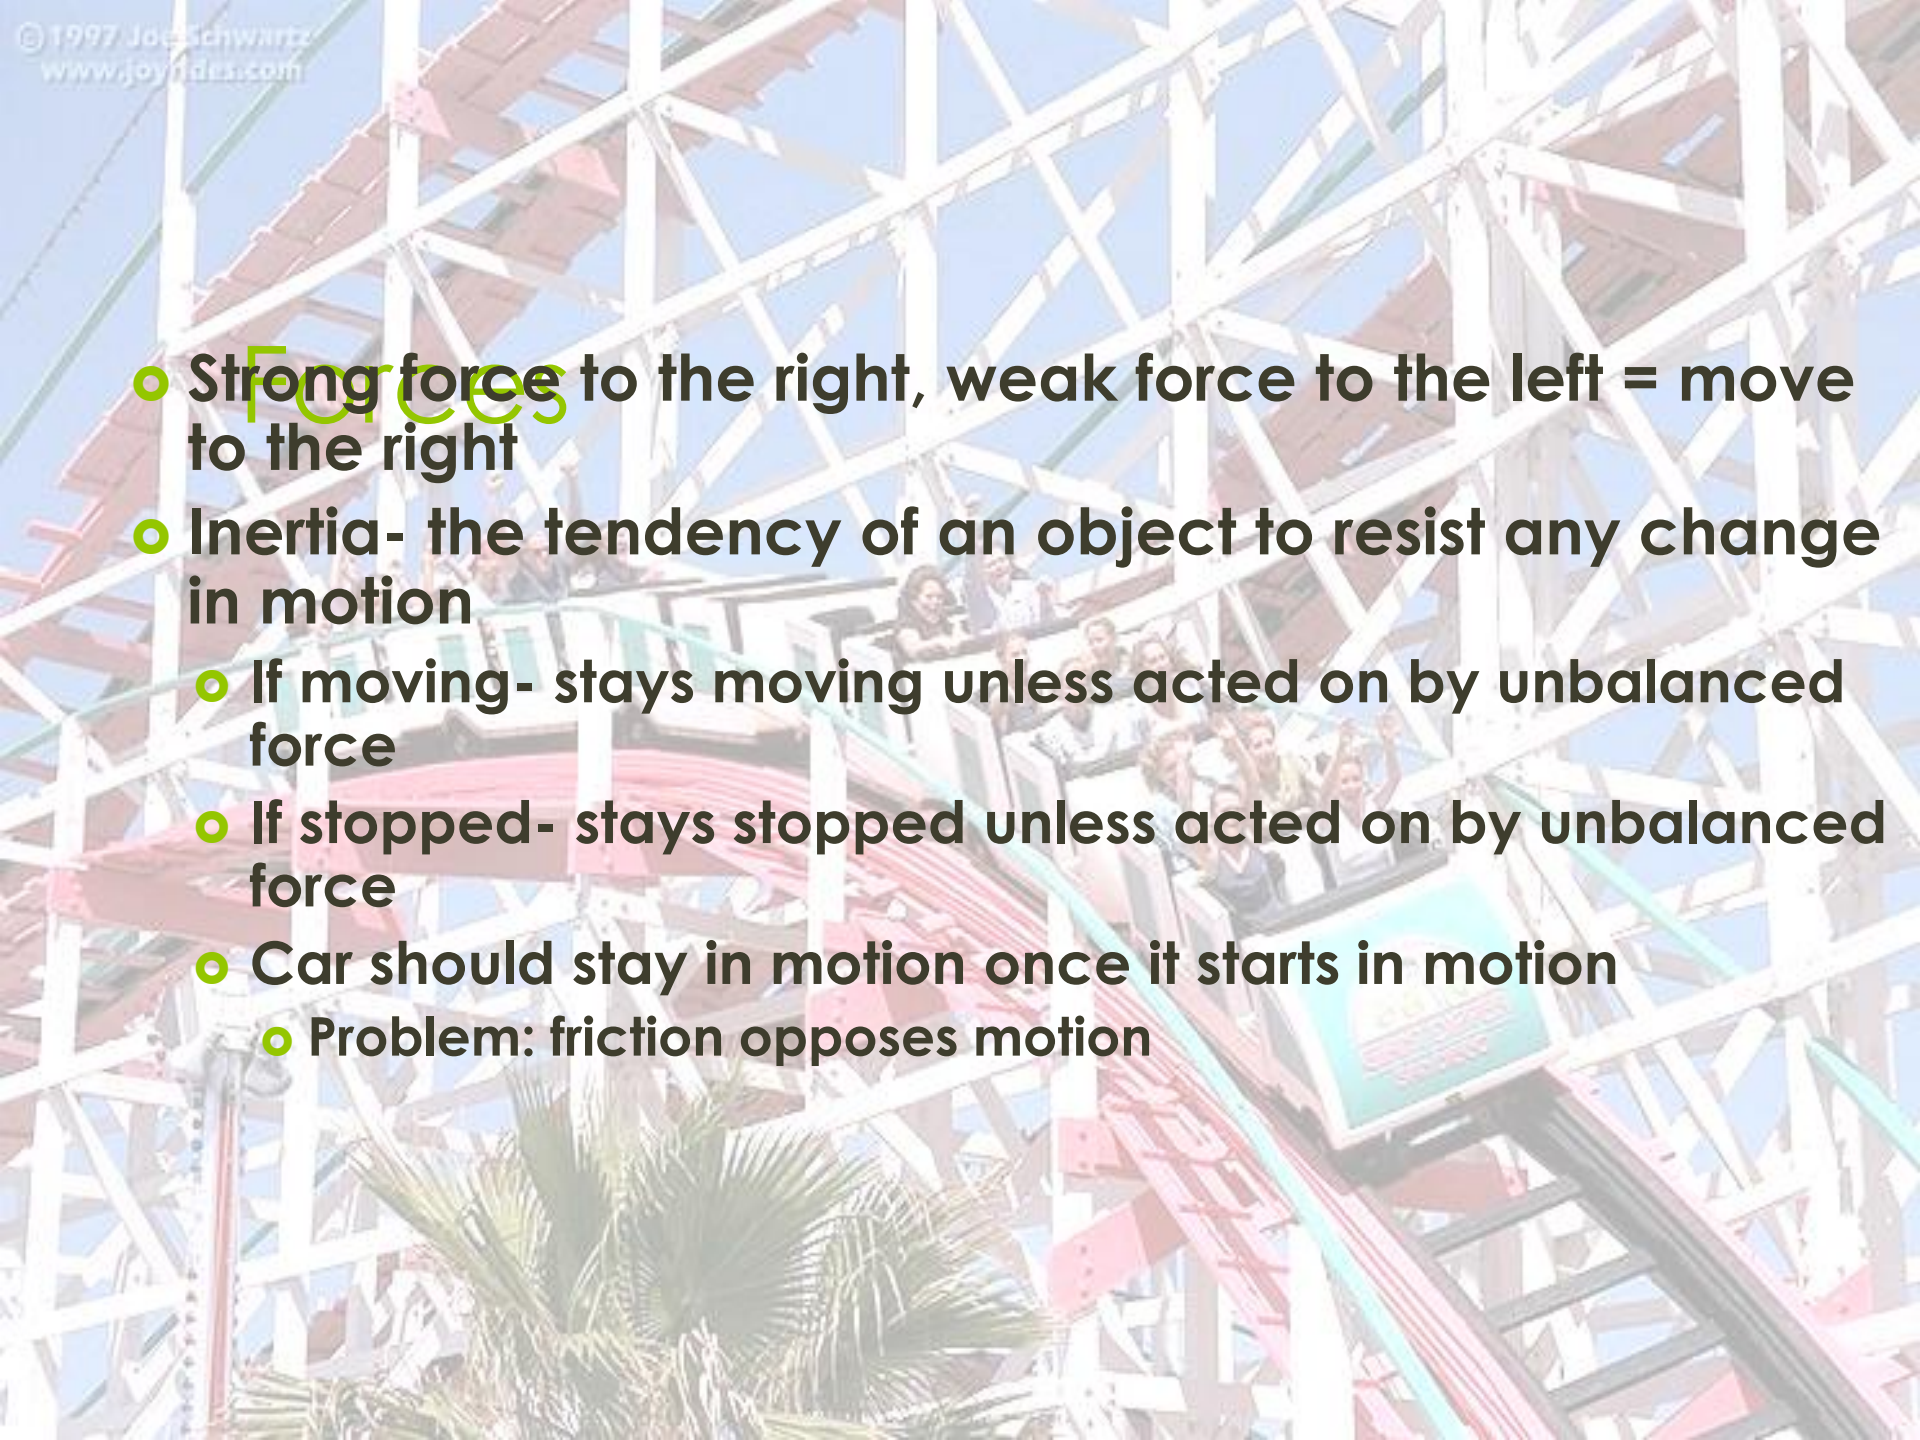

Physical Science 2.3

- 
- A photograph of a roller coaster car full of people on a track. The car is moving down a steep drop. The track is made of white and red wooden beams. The background is a clear blue sky. The roller coaster is a classic wooden coaster.
- **Forces** push or pull that one object exerts on another
 - Examples: hitting a baseball, throwing a basketball, etc.
 - Forces aren't always noticeable
 - Floor pushes up on you- otherwise you'd fall
 - Forces influence motion
 - Changes the velocity- either the speed or direction

- 
- A roller coaster car is shown at the peak of a track, with several people inside. The track is made of white and red metal beams. The background is a clear blue sky with some palm trees visible at the bottom. The word 'Forces' is written in large green letters on the left side of the image.
- **Forces** - Total force on an object
 - If forces are balanced, no movement occurs- net force is zero
 - Balanced forces- forces equal in size but opposite in direction
 - Why don't you fall through the floor??
<http://www.teachersdomain.org/resources/phy03/sci/phys/mfw/goalstring/index.html>
 - Unbalanced force- force that is not balanced by another force
 - Results in movement

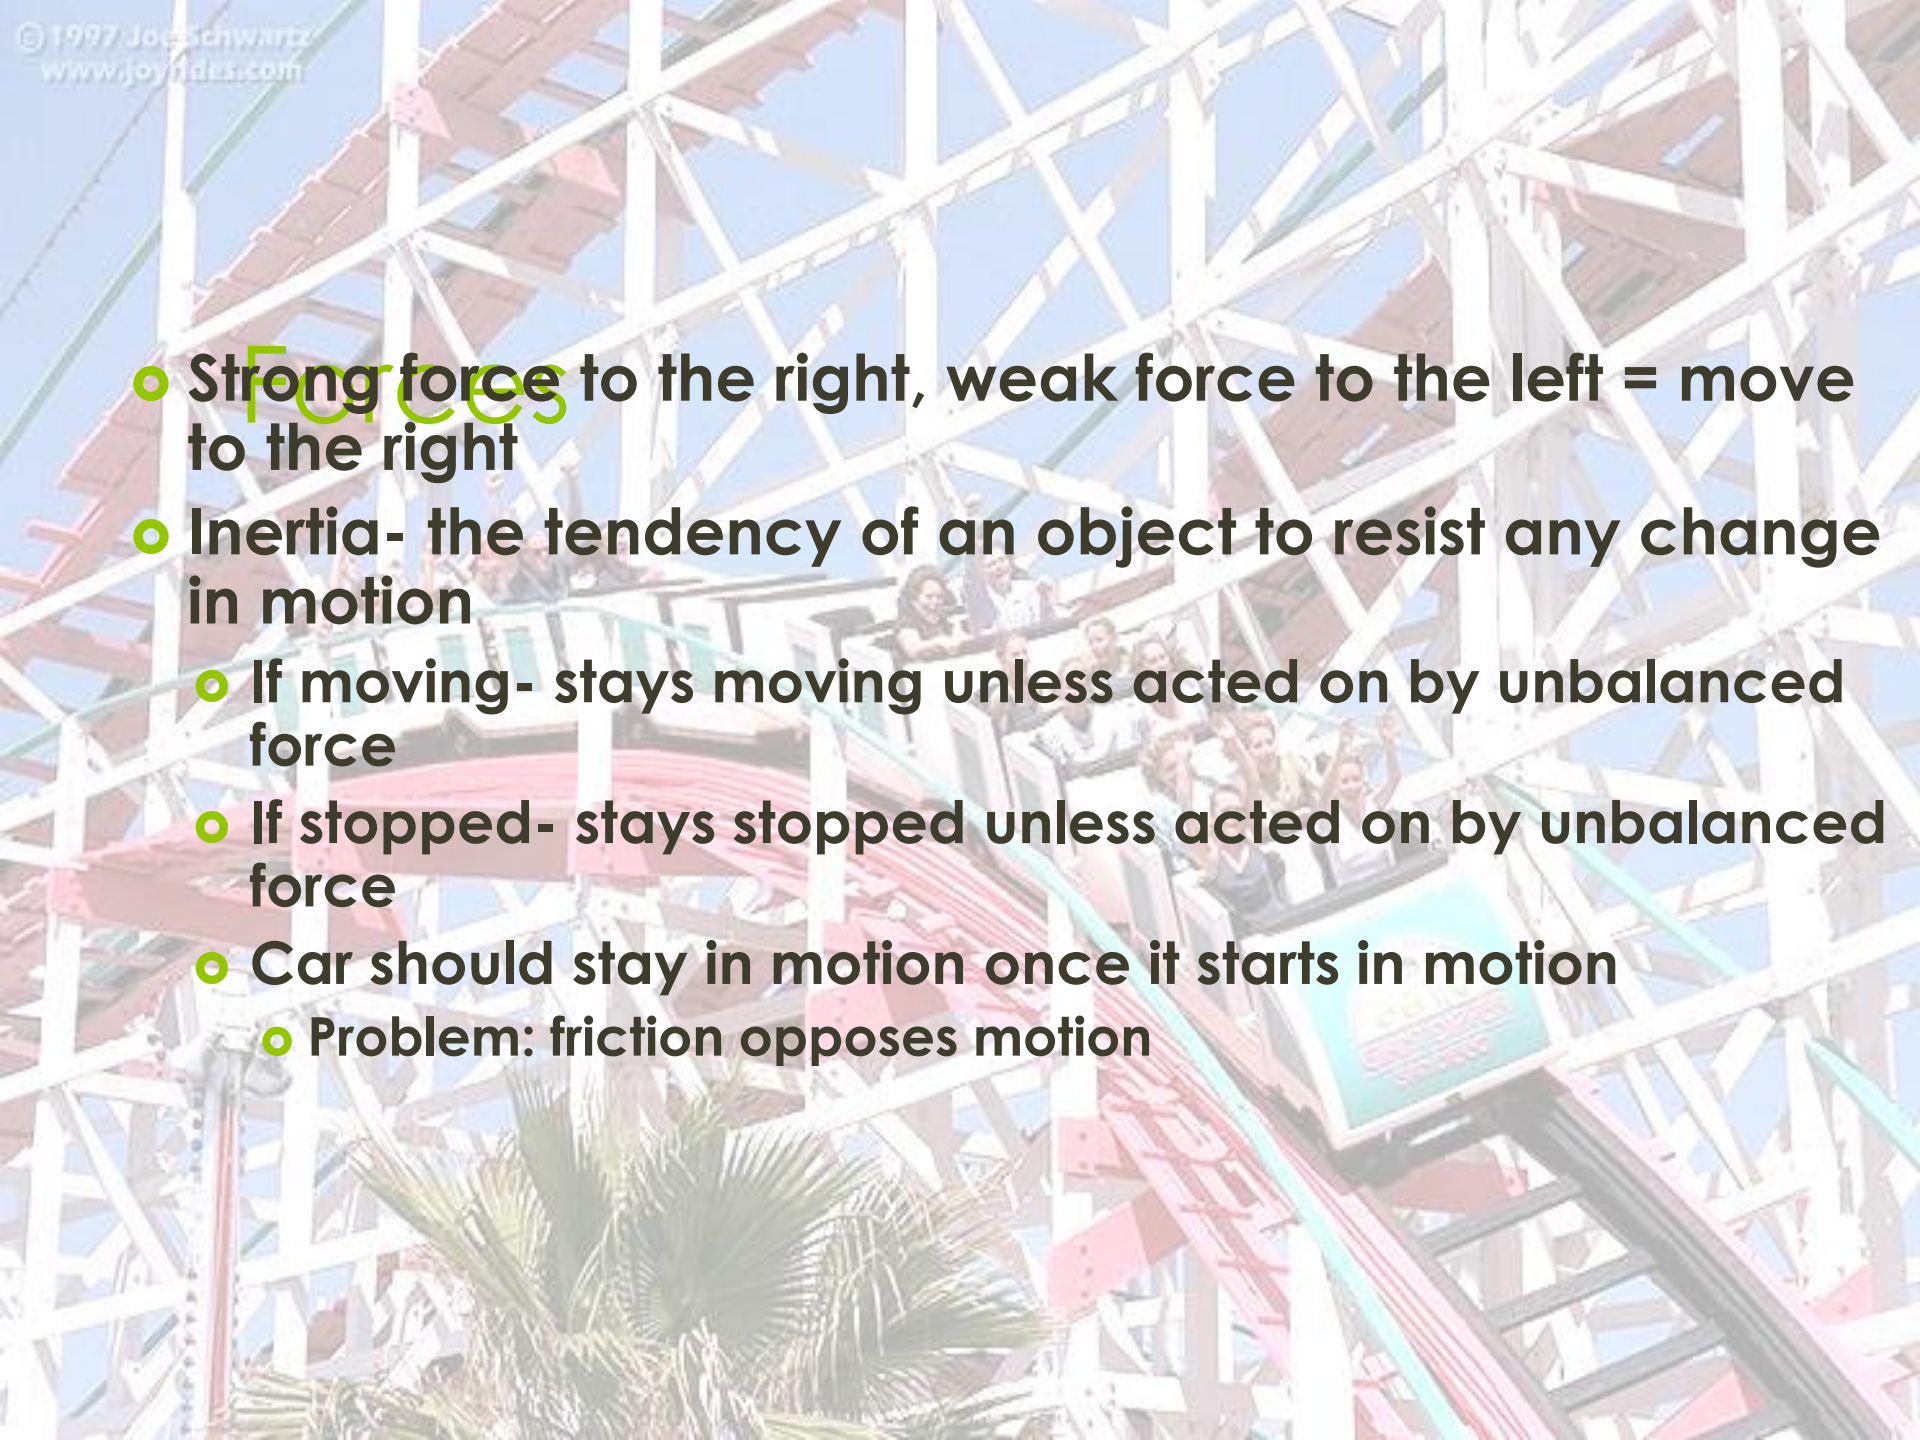

**The forces on the person
are balanced.**

- 
- Forces**
- Strong force to the right, weak force to the left = move to the right
 - Inertia- the tendency of an object to resist any change in motion
 - If moving- stays moving unless acted on by unbalanced force
 - If stopped- stays stopped unless acted on by unbalanced force
 - Car should stay in motion once it starts in motion
 - Problem: friction opposes motion

Forces

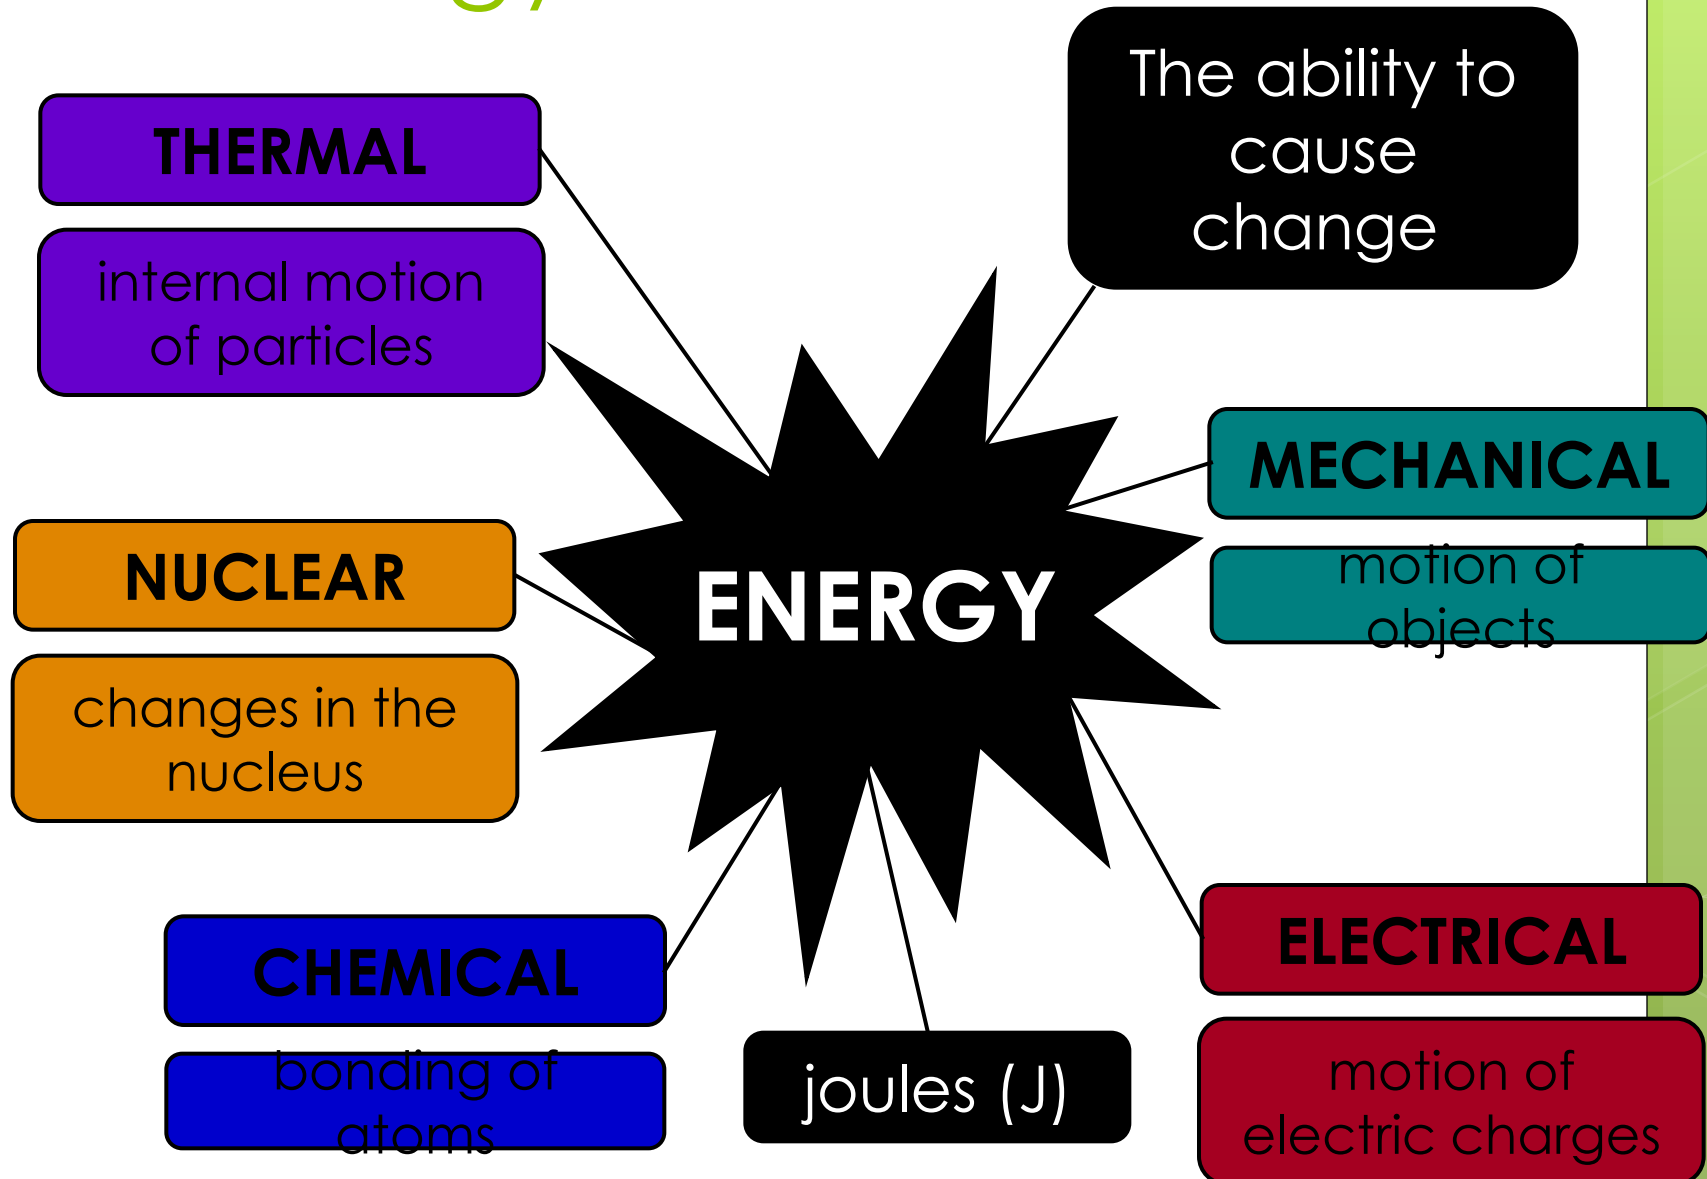

- Inertia and injury
 - In car crashes, you tend to remain in motion until you are acted on by a force (until you hit something that resists you)
- Seatbelts
 - Prevents people from being thrown from the car- provides unbalanced force to stop inertia
 - Increases time over which patient slows

- 
- Forces**

A. Energy

A. Energy

- **Kinetic Energy (KE)**

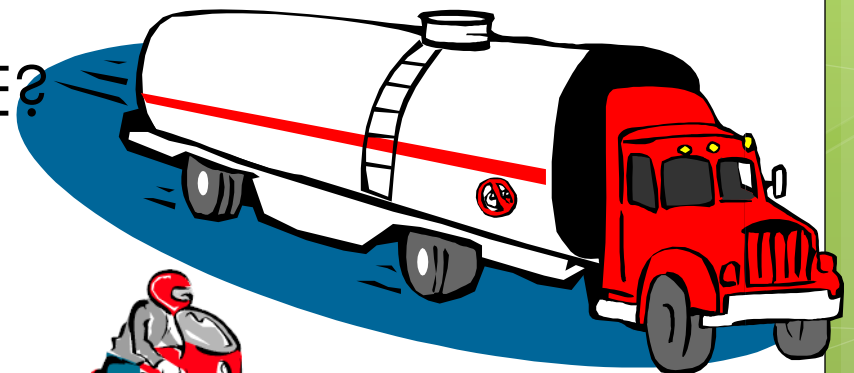

- energy in the form of motion
- depends on mass and velocity

- Which has the most KE?

80 km/h truck

- Which has the least KE?

50 km/h motorcycle

50 km/h

80 km/h

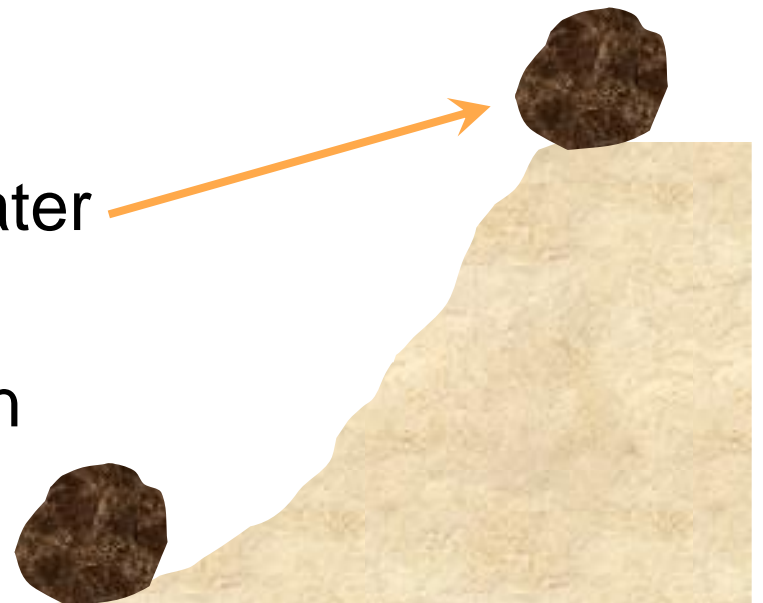

80 km/h

A. Energy

○ Potential Energy (PE)

- stored energy
- depends on position or configuration of an object

- Which boulder has greater gravitational PE?
- What other ways can an object store energy

C. Conservation of Energy

- **Law of Conservation of Energy**

- Energy may change forms, but it cannot be created or destroyed under ordinary conditions.

- EX:

- PE → KE

- mechanical → thermal

- chemical → thermal

C. Conservation of Energy

$$PE \leftrightarrow KE$$

View [pendulum animation](#).

View [roller coaster animation](#).

C. Conservation of Energy

Mechanical \rightarrow Thermal
